Revisit: Phase

- Offset in the displacement from a specified reference point at time $t = 0$
- For a sinusoidal signal,

$$x(t) = A \cdot \sin(2\pi ft + \theta)$$

Amplitude Carrier frequency Phase

- Example:
 - $\cos(2\pi ft) = \sin(2\pi ft + \frac{\pi}{2})$: phase-shift between cosine and sine functions is $\pi/2$

Terms: in- and quadrature- phase

- You may encounter **in-phase** and **quadrature-phase** in studying communication theories.
 - Consider two sinusoidal signals:

$$A(t)\sin(2\pi ft + \varphi(t)) = I(t)\sin(2\pi ft) + Q(t)\sin(2\pi ft + \frac{\pi}{2})$$

$$A(t)\cos(2\pi ft + \varphi(t)) = I(t)\cos(2\pi ft) + Q(t)\cos(2\pi ft + \frac{\pi}{2})$$

where

$$I(t) = A(t) \cos(\varphi(t)), \quad Q(t) = A(t) \sin(\varphi(t)),$$

- Same phase with carrier: in-phase component $I(t)$
 - $2\pi/4$ out of phase from carrier: quadrature-phase component $Q(t)$

PSK - Phase Shift Keying

- PSK sends digital data
 - Changing phase of a carrier frequency
 - Selecting a finite set of phases

$$s_b(t) = A \cos(2\pi f t + \varphi(t))$$

PSK Symbols Set of **distinct** number of phases

4

BPSK - Binary PSK

- Use **two** phases
- Q: What would be the best phase selection?
- A: 0 and 180 degrees
- Q: Why?
- A: Can minimize the ambiguity between two phases
- Constellation:

5

BPSK

- Expression:

$$s_i(t) = A \cos(2\pi ft + \pi(1 - i)), \quad i = 0, 1$$

$$s_0(t) = A \cos(2\pi ft + \pi) = -A \cos(2\pi ft)$$

$$s_1(t) = A \cos(2\pi ft)$$

- Thus, basis function is $\phi(t) = A \cos(2\pi ft)$

- i.e.,

$$s_0(t) = -\phi(t), \quad s_1(t) = \phi(t)$$

6

QPSK - Quadrature PSK

- Use **four** phases
- Q: What would be the best phase selection?
- A: 45, 135, 225, and 315 degrees
- Q: Why?
- A: Can minimize the ambiguity among four phases
- Constellation:

<http://mcnl.ewha.ac.kr>

7

QPSK

- Expression:

$$s_i(t) = A \cos(2\pi f t + \frac{\pi}{4}(2i - 1)), \quad i = 1, 2, 3, 4$$

$$i = 1, 2, 3, 4 \Rightarrow \frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \frac{7\pi}{4}$$

- Basis functions are:

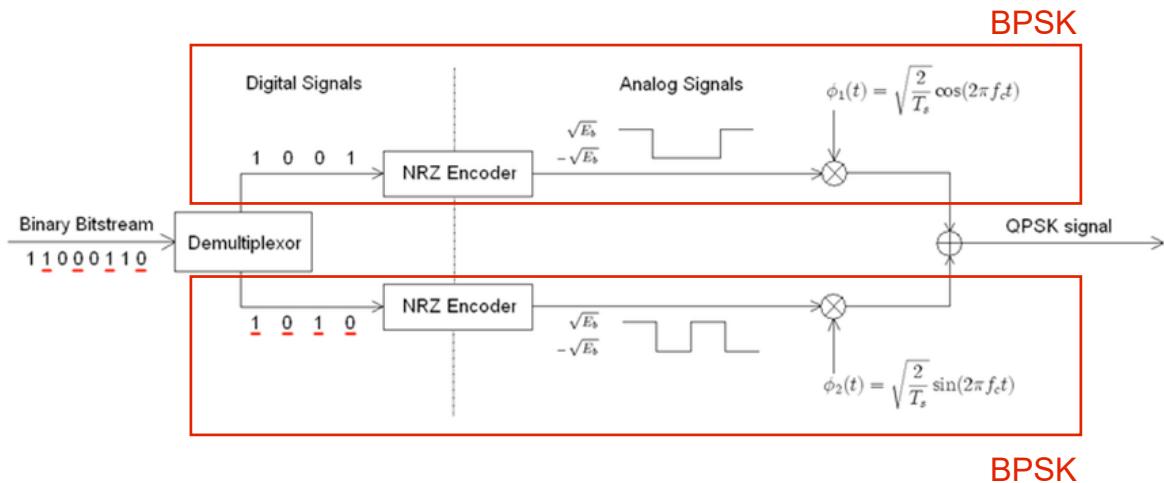

$$\phi_1(t) = A \cos(2\pi f t), \quad \phi_2(t) = A \sin(2\pi f t)$$

8

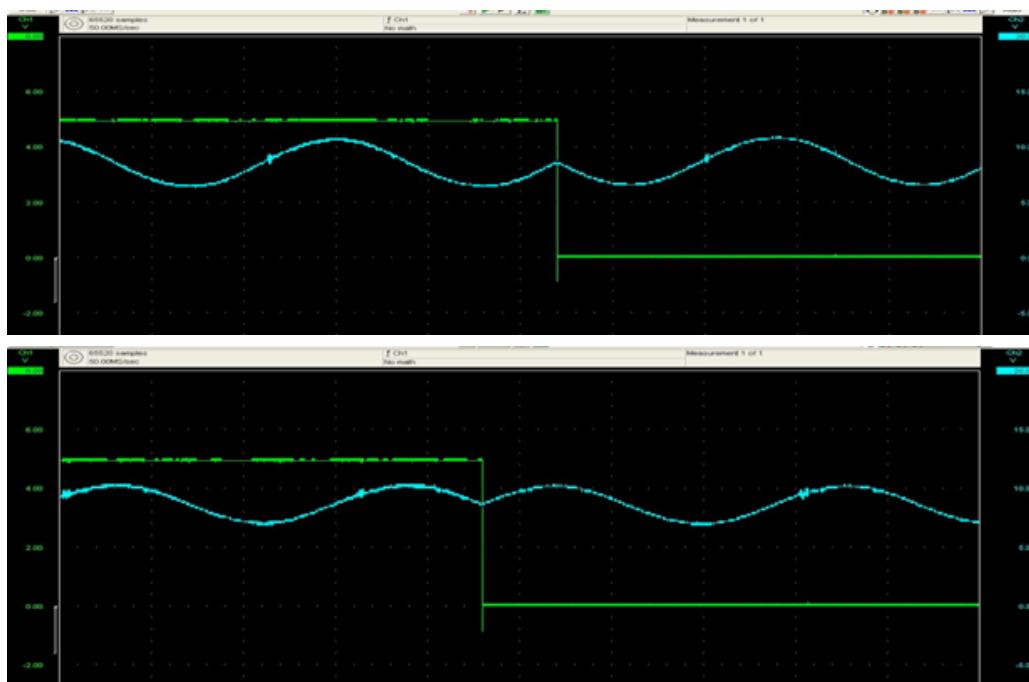

→ QPSK can be considered as two independent BPSKs!

Potential Results

- Try to observe phase changes when input signals are changing

Potential Results

- Based on different line encoding types:
